This represents a the N-terminal sequence of the human heart Of the Quoosyltransferase that can glycosylate an epidermal growth factor (EGF) domain of a polypeptide with an activated O-fucose residue. Inhibitors of O-fucosyltransferase, e.g. mutants with increased affinity for the EFG domains, are used in diagnosis and treatment of conditions associated with overexpression of O-fucosyltransferase, to promote survival of sensory (retinal) neurons. Probes based on EGF domain polypeptide are used to detect gene amplification and expression. The expression can also be determined at the protein level using antibodies specific for O-
                                                                                                                                                                                     ö
domains, are used in diagnosis and treatment of conditions associated with overexpression of O-fucosyltransferase, to promote survival of sensory (retinal) neurons. Probes based on EGF domain polypeptide are used to detect gene amplification and expression. The expression can also be determined at the protein level using antibodies specific for O-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This represents a human heart O-fucosyltransferase that can glycosylate an epidermal growth factor (EGF) domain of a polypeptide with an activated O-fucose residue. Inhibitors of O-fucosyltransferase, e.g. diagnosis and treatment of conditions associated with overexpression of fucosyltransferase, to promote survival of sensory (retinal) neurons. Probes based on EGF domain polypeptide are used to detect gene amplification and expression. The expression can also be determined at the protein level using antibodies specific for O-fucosyltransferase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   61

The invention relates to human tumour-associated aniu-genic carget. Uraxi, polypeptides, and their related nucleic acids. The TAT polypeptides are overexpressed in cancer tissues compared to normal tissues, and may thus serve as effective targets for the diagnosis and treatment of cancer in mammals. The invention also relates to nucleic acid and polypeptide acids and polypeptides at least 80% identical to the TAT nucleic acids and polypeptides; antibody specific for a TAT polypeptide; a specific or a TAT polypeptide; a specific or organic molecule which binds to a TAT polypeptide; fusion proteins comprising a TAT polypeptide; and methods and compositions for the treatment or diagnosis of cancer in mammals. TAT polypeptides, nucleic acids, antibodies, antagonists, binding molecules and compositions are useful for diagnosing or treating a cell proliferative disorder associated with increased TAT expression, particularly cancers such as breast cancer, colorectal cancer, lung cancer, oversian cancer, lung cancer, cervical cancer, cancers of the central cancer, manning in TAT pulverseatic cancer, earlier and leukaemia TAT nucleic acids may further be cancer the cancer in the cancer in the cancer in the cancer in the cancer in the cancer in the cancer in the cancer in the cancer in the cancer in the cancer in the cancer in the cancer in the cancer in the cancer in the cancer in the cancer in the cancer in the cancer in the cancer in the cancer in the cancer in the cancer in the cancer in the cancer in the cancer in the cancer in the cancer in the cancer in the cancer in the cancer in the cancer in the cancer in the cancer in the cancer in the cancer in the cancer in the cancer in the cancer in the cancer in the cancer in the cancer in the cancer in the cancer in the cancer in the cancer in the cancer in the cancer in the cancer in the cancer in the cancer in the cancer in the cancer in the cancer in the cancer in the cancer in the cancer in the cancer in the cancer in the cancer in the cancer in the cancer in the can

Human O-fucosyl:transferase able to glycosylate epidermal growth factor domains - useful for diagnosis and treatment of diseases involving

Example; Fig 13B; 90pp; English.

overexpression of the enzyme.

```
This represents the amino acid sequence of the human heart O-fucosyltransferase expressed by a plasmid insertion. The human O-fucosyltransferase can glycosylate an epidermal growth factor (EGF) domain of a polypeptide with an activated O-fucose residue. Inhibitors of O-fucosyltransferase, e.g. mutants with increased affinity for the EFG domains, are used in diagnosis and treatment of conditions associated with overexpression of O-fucosyltransferase, to promote survival of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           with overexpression of O-fucosyltransferase, to promote survival of sensory (retinal) neurons. Probes based on EGF domain polypeptide are used to detect gene amplification and expression. The expression can also be determined at the protein level using antibodies specific for O-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; cytokine; cell proliferation; cell differentiation; gene therapy;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to polynucleotides (AAKS1456-AAKS3435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, heematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity tissue growth factor activity, immunomodulatory activity and activity insue growth factor activity, immunomodulatory activity and inflammation. Note: Records for SEQ ID NO 2100 (AAKS2581), 2111 (AAKS2582) and 3666 (AAM80420) are omitted as the relevant pages from the sequence listing were missing at the time of publication
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1;

The invention relates to polymuclectides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polymuclectides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides are useful in gene therapy, vaccines or e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity tissue growth factor activity, immunomodulatory activity and activity tissue growth factor activity, immunomodulatory activity and activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: Records for SEQ ID NO 2110 (AAK52581), 2111 sequence listing were missing at the time of publication
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Nucleic acids encoding polypeptides with cytokine-like activities, useful in diagnosis and gene therapy.

```
The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human O-fucosyl:transferase able to glycosylate epidermal growth factor domains - useful for diagnosis and treatment of diseases involving overexpression of the enzyme.
                                       New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                   insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL10511), expressed DNA sequences (ABL101840-ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 O-fucosyltransferase; epidermal growth factor; EGF; glycosylation; O-fucose; inhibitor; sensory neuron; retinal neuron; human; heart.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ô
                                                                                                                                                                                                                                                                                                                 This represents a published partial human sequence of unknown function from a myeblast cell line. The invention provides a human heart Ofucosyltransferase enzyme that can glycosylate an epidermal growth factor (EGF) domain of a polypeptide with an activated Ofucose residue. Inhibitors of Ofucosyltransferase, e.g. mutants with increased affinity for the EFG domains, are used in diagnosis and treatment of conditions associated with overexpression of Ofucosyltransferase, to promote polypeptide are used to detect gene amplification and expression. The expression can also be determined at the protein level using antibodies specific for Ofucosyltransferase
                                                                                                                                                                                                                              Human O-fucosyl:transferase able to glycosylate epidermal growth factor domains - useful for diagnosis and treatment of diseases involving overexpression of the enzyme.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Drosophila; developmental biology; cell signalling; insecticide;

         This represents the N-terminal amino acid sequence of the human heart O-fucosyltransferase expressed by a plasmid insertion. The human O-fucosyltransferase can glycosylate an epidermal growth factor (EGF) domain of a polypeptide with an activated O-fucose residue. Inhibitors of O-fucosyltransferase, e.g. mutants with increased affinity for the EFG domains, are used in diagnosis and treatment of conditions associated with overexpression of O-fucosyltransferase, to promote survival of sensory (tetinal) neurons. Probes based on EGF domain polypeptide are used to detect gene amplification and expression. The expression can also be determined at the protein level using antibodies specific for O-fucosyltransferases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human, signal peptide-containing protein, HSPP; diagnosis; cancer; inflammation; cardiovascular disease; anticancer; anti-inflammatory; antimicrobial; nootropic; neuroprotective; cardiovascular; hepatotropic; antiasthmatic; gene therapy; cell proliferation; neurological disorder; reproductive disorder; developmental disorder; arteriosclerosis; cirrhosis psoriasis, acquired immune deficiency syndrome; anaemia; asthma; Crohn's disease; infection; Alzheimer's disease; schizophrenia; Parkinson's disease; Huntington's diseases; ovulatory defect;

the contraction of the containing proteins HSPP-1 to HSPP-134. HSPPs have anticancer, anticancer, anticancer, anticancer, anticancer, anticancer, anticancer, anticancer, anticancer, anticancer, anticancer, anticancer, anticancer, anticancer, anticancer, and can be used in gene therapy. HspPs can be used to treat or prevent disorders associated with decreased activity or function of HSPP. Antagonists of associated with decreased activity or function of HSPP. Such diseases include cell profiferation (including cancer), inflammation, cardiovascular, neurological, reproductive or developmental disorders, (e.g. arteriosclerosis, cirrhosis, pooriasis, adquired immune deficiency syndrome, annewis, cirches, pooriasis, adquired immune deficiency syndrome, annewis, cirches, pooriasis, and cropial or other infections, congestive or ischaemic heart disease, Alzheiner's Parkinson's or Huntingcon's modelic acids can be used for the recombinant production of HSPP, for detecting HSPP in standard hybridisation and maplification assays (for disposis and monitoring), in gene therapy, as antisense, triplex-forming variations, and for chromosomal mapping HSPP are also used to raise (specific antibodies (hb) and to screen for adouts and antagonists or gonetic agent, as even used to dispose, or monitor, HSPP concepted diseases (in usual immunoassays), as therapeutic antagonists, in general immunoassays), as therapeutic antagonists, in competitive drug screens, and for purification of HSPP from natural
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             screening

                                                                                                                                                                                                                                                                                                                                                               ð
                 The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the 6213 antisense sequences given in the specification where expression of the mucleic acid inhibits proliferation of a cell. Also included are: (1) a vector comprising a promoter operably linked to the nucleic acid concluded as inhibited by the antisense concluding a polypeptide whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation or that has an activity against a biological pathway required for proliferation, or that that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation required gene product the test compound that inhibits spond for a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compund activity; (11) a culture comprising strains in which the extent or organism acts; (9) manufacturing an antibiotic; (10) profiling a compund activity; (11) a culture comprising strains in which the extent or organism acts; (13) identifying the target of a compound that inhibits proliferation of an organism. The antisense nucleic acids are useful for totilular proliferation of an organism. The antisense mucleic acids are useful for form proliferation in cells other than S. aureus, S. typhimurium, cform the prokaryotic essential genes candidate molecules for proliferation in cells other than S. aureus, S. typhimurium, cform part of the printed specification, but was obtained the form part of the printed specification, but was obtained the form part of the printed specification, but sequence data for this concention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                                    The invention relates to isolated Streptococcus pneumoniae nucleic acids and polypeptides. The nucleic acids and proteins are useful for diagnosing, preventing and treating pathological conditions resulting from bacterial infection, such as S. pneumoniae infection. These may also be used for drug screening procedures. The present sequence represents a Streptococcus pneumoniae polypeptide of the invention. Note: The sequence data for this patent did not appear in the printed specification but was obtained in electronic format directly from USPTO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Bacterial meningitis; pneumonia; sepsis; otitis media; ear infection; antinflammatory; antibacterial; immunostimulant; auditory; respiratory; gene therapy; vaccine.

expressed from 2469 of 2489 identified DNA coding regions from the expressed from 2469 of 2489 identified DNA coding regions from the Streptococcus pneumoniae type 4 strain genomic sequence appearing as a treating a patient by administering the protein, DNA or antibody (in a composition), a kit comprising first and second primers, which are the nucleic acid cited above or fragments between nuclectides 8-100 of a sequence contained within a Streptococcus nucleic acid sequence, where the first primer is substantially complementary to the target sequence to the target sequence, and where the parts of the primers having substantially complementary to the target sequence on the target sequence and the second primer is substantially complementary to the complement of the target sequence to be amplified, assay comprising contacting a test compound with the protein, and determining whether the test compound binds to the protein and a Streptococcus pneumoniae bacterium, where one or more genes conding the proteins has been rendered inactive. The proteins, nucleic acid molecules, antibody and compositions are useful as medicaments for treating or preventing a disease or infection due to streptococcus card molecules, antibody and compositions are useful as medicaments for treating or preventing a disease or infection due to streptococcus card antibiotics. The methods are useful for identifying immunodominant proteins. The present sequence is one of the 4469 proteins expressed by the identified coding regions from the genomic sequence. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the the proteins of the printed specification, but was obtained in electronic format directly from WIPO at the dentified or steplence is one of the 21-2003 to the standardise OS field)

New isolated nucleic acid encoding a Streptococcus pneumoniae polypeptide, useful for diagnosing, preventing and/or treating

The invention relates to an isolated nucleic acid comprising a sequence encoding a Streptococcus pneumoniae ADR91366polypeptide, or its fragments, with any of 9 fully defined sequences (appearing as ADR94308, ADR94609, ADR94600, ADR94609, ADR94609, ADR956253, ADR95642, ADR95662, ADR996079) or any of the fully defined sequences appearing as ADR941705, ADR91806, ADR91806, ADR91807, ADR92234, ADR93039, ADR92360, ADR91806, ADR91807, ADR921807, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR92306, ADR92306, ADR931807, ADR921807, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079, ADR923079 ۲; Gaps 3; pathological conditions resulting from the bacterial infection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     US-08-17-14

Sequence 14, Application US/08978741

Sequence 14, Application US/08978741

Patent No. 6100006;

PAPLICANT: Yang Wang, Michael W. Spellman

TITLE OF INVENTION: O-Fucosyltransferase

NUMBER OF SEQUENCES: 17

CORRESPONDENCE ADDRESS:
ADDRESSEE: Genetech, Inc.
STREET: 1 DNA Way

CITY: South San Francisco

STATE: California

COUNTRY: USA
                                                                                                                                 APPLICANT: Wang, Yang
APPLICANT: Spellman, Michael W.
TITLE OF INVENTION: O-Fucosyltransferase
TITLE REPERENCE: Pl041P1D1-Subsetitute
CURRENT APPLICATION NUMBER: US/09/333,729A
CURRENT PILIAG DATE: 1999-06-15
PRIOR APPLICATION NUMBER: US 08/798,741
PRIOR FILING DATE: 1997-11-26
NUMBER OF SEQ ID NOS: 21
SEQ ID NO 12
LENGTH: 474
TYPE: PRT
CACHOLHADALISM: CACHOLHADALISE Elegans
Sequence 12, Application US/09333729A
Patent No. 6270987
GENERAL INFORMATION:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 28 amino acids
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           TYPE: Amino Acid

"A new superfamily of protein-0-fucosyltransferases; phylogeny and
identification of conserved peptide motifs.";
Glycobiology 13:10-5C(2003)
-1- FUNCTION: Catalyzes the reaction that attaches fucose through an
0-glycosidic linkage to a conserved serine or threonine residue in
G-glycomains (By simlarity).
-1- GATALYTIC ASTIVITY: Transfers an alpha-L-fucosyl residue from GDP-
beta-L-fucose to the serine hydroxy group of a protein acceptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              0; Gaps

Romeration and initial analysis of more than 15,000 full-length human and O-glycosidic linkage to a conserved serine or threonine residue in CG Gongor CC T. CATALYTIC ACTIVITY: Transfers an alpha-L-fucose through an O-glycosidic linkage to a conserved serine or threonine residue in CG C.I. CATALYTIC ACTIVITY: Transfers an alpha-L-fucose to the serine hydroxy group of a protein acceptor.

C.I. CATALYTIC ACTIVITY: Transfers an alpha-L-fucosyl residue from CC C.I. COPACTOR: Mangarnes (By similarity).

C.I. CATALYTIC School College of the glycosyltransferse 68 family.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Neuherberg, GERMANY
Clone from S. Wiemmann, Molecular Genome Analysis, German Cancer
Research Center (NFEZ); Email s.wiemann@dkfz-heidelberg.de;
Research Center (NFEZ); Email s.wiemann@dkfz-heidelberg.de;
sequenced by AGONA (Berlin/Germany) within the CDNA sequencing
consortium of the German Genome Project.
This clone (DKFZ9451J114) is available at the RZPD in Berlin.
Please contact the RZPD: Ressourcenzentrum, Heubnerweg 6, 14059
Berlin-Charlottenburg, GERWANY; Email: clone@rzpd.de Further
information about the clone and the sequencing project is available

This is the 5' sequence of the clone insert Clone from S. Wiemann,
This is the 5' sequence of the clone insert Clone from S. Wiemann,
Molecular Genome Analysis, German Cancer Research Center (DKFZ);
Email s.wiemann@dkz-heidelberg.de; sequenced by BMFZ (Biomedical
Research Center at the Heinrich-Heine-University,
Duesseldorf/Germany) within the cDNA sequencing consortium of the
German Genome Project. This clone (DKFZ9459B068) is available at
the RZPD in Berlin. Please contact the RZPD: Reseaucrenzentrum,
Heubnerweg 6, 14059 Berlin-Charlottenburg, GERMANY; Email:
clone@rzpd.de Further information about the clone and the
sequencing project is available at
http://mips.sgf.de/projects/cdna/.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                               61

But strand cDNA was Drimed With a NotI-oligo(dY) primer. Five prime

end enriched, double-strand cDNA was digested with Not I and cloned

into the Not I and EcoR V sites of the pCWVSPORT 6 vector. Library

was normalized. Library was constructed by Life Technologies, a

division of Invitrogen. This sequence belongs to sequence cluster

1st strand cDNA was primed with a NotI--oligo(dT) primer. Five prime
end enriched, double-strand cDNA was digested with Not I and cloned
into the Not I and EcoR V sites of the pCMVSFORT 6 vector. Library
was normalized. Library was constructed by Life Technologies, a
division of Invitrogen. This sequence belongs to sequence cluster
                                                                                                                                                                                           BX345989
